Description

The CoolRunner-II 384-macrocell device is designed for both high performance and low power applications. This lends power savings to high-end communication equipment and high speed to battery operated devices. Due to the low power stand-by and dynamic operation, overall system reliability is improved.

This device consists of twenty four Function Blocks inter-connected by a low power Advanced Interconnect Matrix (AIM). The AIM feeds 40 true and complement inputs to each Function Block. The Function Blocks consist of a 40 by 56 P-term PLA and 16 macrocells which contain numerous configuration bits that allow for combinational or registered modes of operation.

Additionally, these registers can be globally reset or preset and configured as a D or T flip-flop or as a D latch. There are also multiple clock signals, both global and local product term types, configured on a per macrocell basis. Output pin configurations include slew rate limit, bus hold, pull-up, open drain and programmable grounds. A Schmitt-trigger input is available on a per input pin basis. In addition to storing macrocell output states, the macrocell registers may be configured as direct input registers to store signals directly from input pins.

Clocking is available on a global or Function Block basis. Three global clocks are available for all Function Blocks as a synchronous clock source. Macrocell registers can be individually configured to power up to the zero or one state. A global set/reset control line is also available to asynchronously set or reset selected registers during operation. Additional local clock, synchronous clock-enable, asynchronous set/reset and output enable signals can be formed using product terms on a per-macrocell or per-Function Block basis.

A DualEDGE flip-flop feature is also available on a per macrocell basis. This feature allows high performance synchronous operation based on lower frequency clocking to help reduce the total power consumption of the device.

Circuitry has also been included to divide one externally supplied global clock (GCK2) by eight different selections. This yields divide by even and odd clock frequencies.

The use of the clock divide (division by 2) and DualEDGE flip-flop gives the resultant CoolCLOCK feature.

DataGATE is a method to selectively disable inputs of the CPLD that are not of interest during certain points in time.

By mapping a signal to the DataGATE function, lower power can be achieved due to reduction in signal switching.

Another feature that eases voltage translation is I/O banking. Four I/O banks are available on the CoolRunner-II 384 macrocell device that permit easy interfacing to 3.3V, 2.5V, 1.8V, and 1.5V devices.

The CoolRunner-II 384 macrocell CPLD is I/O compatible with various I/O standards (see [Table 1](#)). This device is also 1.5V I/O compatible with the use of Schmitt-trigger inputs.

RealDigital Design Technology

Xilinx CoolRunner-II CPLDs are fabricated on a 0.18 micron process technology which is derived from leading edge FPGA product development. CoolRunner-II CPLDs employ RealDigital a design technique that makes use of CMOS technology in both the fabrication and design methodology. RealDigital design technology employs a cascade of CMOS gates to implement sum of products instead of traditional sense amplifier methodology. Due to this technology, Xilinx CoolRunner-II CPLDs achieve both high-performance and low power operation.

Supported I/O Standards

The CoolRunner-II 384 macrocell features LVCMOS, LVTTTL, SSTL and HSTL I/O implementations. See [Table 1](#)

for I/O standard voltages. The LVTTTL I/O standard is a general purpose EIA/JEDEC standard for 3.3V applications that use an LVTTTL input buffer and Push-Pull output buffer. The LVCMOS standard is used in 3.3V, 2.5V, 1.8V applications. Both HSTL and SSTL I/O standards make use of a V_{REF} pin for JEDEC compliance. CoolRunner-II CPLDs are also 1.5V I/O compatible with the use of Schmitt-trigger inputs.

| Date | Version | Revision |
|----------|---------|---|
| 07/14/06 | 3.0 | Move to Product Specification. Changes to - 7 speed grade: T_{SUD} , T_{SU1} , T_{SU2} , T_{CO} , T_{PCO} , T_F , F_{EXT1} , T_{GCK} , T_{ECSU} , T_{COI} , T_{SUEC} , T_{CW} and F_{EXT2} . Changes to -10 speed grade: T_{SUD} , T_{SU1} , T_{SU2} , T_{PSUD} , $F_{SYSTEM1}$, $F_{SYSTEM2}$, F_{EXT} , and F_{EXT2} . Change to Test Conditions for V_{OH} and V_{OL} on HSTL1 DC Voltage Specifications, page 5 (V_{CCIO} goes to 1.4V from 1.7V). |
| 02/15/07 | 3.1 | Corrections to timing parameters t_{OEM} for -6 speed grade, and to t_{DIN} , t_{SUI} , t_{ECSU} , t_{PSU1} , t_{PSU2} , t_{PHD} , and t_{SUEC} for the -7 speed grade. Values now match the software. There were no changes to silicon or characterization. Change to V_{IH} specification for 2.5V and 1.8V LVCMOS. |
| 03/08/07 | 3.2 | Fixed typo in note for V_{IL} for LVCMOS18; removed note for V_{IL} for LVCMOS33. |
